

Digital Television Reception

Our antennas are designed to receive both VHF and UHF channels. The antennas can receive both digital and analog signals. If your TV is digital, you do not need a converter box or any other external, add-on device. If your antenna was working prior to the digital change, it is probably working now. Check the TV or the settings if you have problems receiving DTV channels. For more troubleshooting tips, see your Owners' Manual, or go to www.antennatek.com.

Note: Many television stations have changed from VHF to UHF channels. UHF channels operate at higher frequencies, the signal does not travel as far as those of VHF.

To ensure proper reception, **when using digital TV** do the following:

1. Raise your antenna and point it towards the signal transmitter. You may find the exact location of the transmitting towers at www.fcc.gov.
2. Turn the switch on the wall plate ON, then turn the power to your TV ON. On the TV menu, set the input of the TV to 'antenna', 'broadcast', or OFF Air.
3. Scan for channels. If you are not satisfied with the quantity of channels you have received, rotate the antenna 90 degrees and rescan for channels. If your TV has the signal strength option, use it to fine tune the antenna for maximum signal strength.

When using analog TV:

1. Disconnect the coaxial cable from the TV and connect it to the input of the converter box. Use an extra coaxial cable to connect the output of the converter box to the input of the TV.
2. Turn on the power to the converter box.
3. Raise your antenna and point it towards the signal transmitter. You can find the available channels for your location at www.fcc.gov
4. Turn the switch on the wall plate ON, then Turn the power on your TV ON. On the TV menu, set the input of the TV to 'antenna', 'broadcast' or OFF Air. Set the TV to either channel 3 or 4, depending on your area.
5. Scan for channels. If you are not satisfied with the quantity of channels you have received, rotate the antenna 90 degrees and rescan for channels. If your converter box has the signal strength option, use it to fine tune the antenna for maximum signal strength.
6. Select different channels to watch by using the remote of the converter box, not the TV.
